

Mariane Mendes Medeiros

Kitchener, ON, Canada
[linkedin.com/in/marianemm](https://www.linkedin.com/in/marianemm)

I'm a Computer Engineer with a master's degree in Computational Mechanics Engineering. As a student, I worked for five years on Scientific Initiation projects in computer science, robotics. In my professional experience, I have worked for nine years as both Solutions Architect and Software Engineer at EMBRAER, the world's third-largest aircraft manufacturer. In this role, I designed, implemented and supported 3D Digital Factory software and enterprise integrations for manufacturing processes and shop floor operations. I also researched new technologies to support these operations.

During my transition from living in Brazil to living in Canada, I joined DRUID, a tech company providing solutions for Telecom, where I held the roles of hands-on AWS Cloud Engineer, and AWS Solutions Architect. Already living in Ontario, I worked as a Solutions Architect at NAVBLUE (an Airbus Company), designing Flight Operations solutions for airline companies, as part of the company's Software Factory technical leadership.

I'm a person with good communication skills, a strong aptitude for detail, and continuous curiosity and willingness to learn. I consider myself a hands-on person, needing little direction to perform my tasks and deliver results. I am also very interested in work-process methodologies and ways to improve the quality and efficiency of work. These traits, along with my ease in dealing directly with stakeholders — from customers to senior management — often lead me to technical leadership positions, where I not only translated customer needs into prioritized, actionable engineering work, but also earned management's trust to introduce new ideas and new ways of doing things.

Work Experience

NAVBLUE, an Airbus Company

[Airbus's flight operations software subsidiary recently rebranded as Skywise.](#)

Solutions Architect

(August 2022 – December 2023) Hybrid – Waterloo, ON, Canada

Directed AWS architecture strategy for Flight Operations software within Navblue's Software Factory, translating business and enterprise-level requirements into deliverable systems for airline customers.

As Solutions Architect:

- Partnered with business and enterprise architects to transform stakeholder requirements into actionable Flight Ops architecture;
- Designed and evolved AWS reference architectures end-to-end - covering requirement analysis, design decisions, budget analysis, disaster recovery plans, security posture, and compliance with industry regulations;
- Served as a technical lead within the SAFE Train leadership structure, guiding development teams across the world through architectural planning and prioritization;
- Introduced process improvements across the Software Factory, shaping how architecture work was standardized and streamlined company-wide.

DRUID

[Established Brazilian technology firm with nearly 30 years of operations spanning South America, Europe, and Africa, delivering digital and cloud-driven solutions serving the sectors of Telecom, Energy, Financial Services, Insurance, Agribusiness, and Media](#)

AWS Cloud Solutions Architect (promoted from AWS Cloud Engineer)

(June 2021 – July 2022) Fully remote – Rio de Janeiro, RJ, Brazil

Drove cloud-first SMS platform modernization for a major Brazilian telecom provider, advancing from hands-on software and infrastructure engineering to architectural leadership within one year.

As AWS Cloud Engineer (June 2021 – October 2021):

- Hands-on implementation of an AWS distributed architecture for the SMS platform modernization, based on cloud serverless design connected to customer's on-premises infrastructure;
- Delivery in production through DevOps and IaC strategies;
- Support of production issues directly with the customer IT team.

As AWS Cloud Solutions Architect (October 2021 – July 2022):

- Advanced into the tech lead role for the SMS platform modernization project, directing AWS architecture decisions;
- Guided stakeholders through decisions on cost, reliability, on-premises-to-cloud integration, and cloud best practices;
- Helped shape company-wide cloud governance to meet AWS best practices and security standards.

AWS service categories within scope of work: networking, compute, containers, databases, storage, application integration, security, identity and compliance, analytics, developer tools, management and governance.

EMBRAER S.A.

Brazil's largest aerospace corporation founded in 1969, being the third-largest civil aircraft manufacturer in the world (right after Airbus and Boeing), innovating in commercial & executive aviation, defense & security, and services & support.

Solutions Architect (concurrent Software Engineer responsibilities)

(June 2011 - July 2020) On-site – São José dos Campos, SP, Brazil

As member of the Digital Solutions for Engineering and Manufacturing Department, I helped shape Embraer's Digital Manufacturing strategy over nine years, from early research and software automation initiatives to enterprise-wide 3D integration and solution architecture at the world's third-largest aircraft manufacturer.

As a Solutions Architect:

- Identified and assessed automation opportunities across engineering operations, aligning digital solutions with aerospace industry standards and aircraft lifecycle regulations;
- Translated business and functional requirements from engineering teams into viable, risk-assessed software solutions — from specification through delivery;
- Evaluated and internalized third-party software into Embraer's technical environment, architecting integration strategies with IT infrastructure teams;
- Researched new technologies to support Manufacturing and Shop Floor processes;
- Became a trusted point of reference for Digital Manufacturing solutions, engaging directly with stakeholders from engineers to senior management;
- Actively contributed to Embraer's Enterprise Excellence Program (P3E), driving operational governance through process standardization, work reuse, and continuous improvement across departments related to Digital Manufacturing;
- Awarded 'EMBRAER Knowledge Enthusiast' by the Vice President of Engineering and Technology, for heavy engagement in knowledge management and sharing company-wide.

As a Software Engineer:

- Developed and maintained third-party software customization with a focus on data integrity and system performance;
- Designed integration strategies to improve data reuse (including 3D models) across systems while preserving compatibility and security compliance;
- Diagnosed third-party software problems through user/system behavior analysis, interacting with R&D of responsible companies to solve them in a global scale;
- Established a metrics-driven process for production support, aligning bug-fix prioritization with customer impact and business needs;
- Authored complex technical documentation and high-level training materials, and defined testing, maintenance, and

lifecycle strategies for delivered software.

Main work projects:

- Customization and maintenance of manufacturing 3D systems (CAPP, 3D model conversions);
- End-to-end integration of product/manufacturing/execution 3D systems (CAD, CAPP, MES) to ERP and satellite components;
- Integration of manufacturing 3D systems (CAPP) to PLM software platform.

Education

Universidade Estadual de Campinas

(2010 – 2013) Campinas, SP, Brazil

Master's Degree, Mechanical Engineering - Computational Mechanics Department

Canadian equivalency: Master's Degree (WES ECA, 2018)

Final Paper: "Simultaneous optimization of structure and controller for vibration minimization via Genetic Algorithms" (<http://repositorio.unicamp.br/jspui/handle/REPOSIP/264939>). Description: The work presents an optimization method where a beam structure and the controller parameters are optimized simultaneously aiming to diminish negative influence between both dynamics (two other optimization approaches are presented by means of comparison). For all three cases, the optimization problem was addressed using Genetic Algorithms and the results were simulated through MATLAB programming.

FURG Universidade Federal do Rio Grande

(2005 – 2009) Rio Grande, RS, Brazil

Bachelor's degree, Computer Engineering

Canadian equivalency: Bachelor's degree, four years (WES ECA, 2018)

Final paper: "Graphical Interface for Dynamic Systems Study". Description: The work broaches the development of graphic interfaces to study dynamical systems and basic concepts of control theory. Designed to be used as didactic tool, the C++/MATLAB software prototype exploits the required characteristics to waken the student's interest in the subject, offering the possibility to accomplish some simple dynamical simulations.

Top Project: "Multi-robot architecture for dynamic system applications (FURGBOL robot's soccer team)". Description: Development of an architecture for autonomous low-cost robots capable of cooperating and playing soccer (F180 category - Robocup.Org). Contribution to the project: research/development on computer vision techniques (C++).

Academic production: <http://lattes.cnpq.br/7272241501780235> (PT-BR)

Main subjects of the program: Theory of Computation, Computer Architecture, Software Engineering, Programming Languages, Data Structures, Operating Systems, Computer Networking, Databases, Compilers, Analysis of Algorithms, Computer Graphics, Numerical Methods, Artificial Intelligence, Robotics.

FURG Universidade Federal do Rio Grande - Colégio Técnico Industrial Prof Mário Alquati, Brazil

(2000 – 2002) Rio Grande, RS, Brazil

High School Technical Education in Software Development

Main subjects of the program: Programming Techniques, Data Structures, Software Engineering, Operating Systems, Statistics. Exposure to intensive logical thinking and practical code programming (mainly C++) during entire program.

Certifications

- **Software Architecture**, 2021, XP Educação (former Instituto de Gestão e Tecnologia da Informação), Brazil
- **Scrum Fundamentals Certified (SFC)**, 2021, Brazil

Skills

- Solutions architecture (end-to-end technical system design, and architectural work processes)
- Architectural patterns and standards
- Distributed systems (services, microservices, serverless, distributed integration patterns, software integration)
- Requirement analysis (business, functional and non-functional)
- Risk assessment for software solutions
- Software development lifecycle
- Cloud (AWS), with design and hands-on experience in main AWS categories such as networking and content delivery, compute, containers, databases, storage, application integration, security/identity/compliance, analytics, developer tools, management and governance
- Technical documentation
- Communication (with both technical engineering and C-level executive stakeholders)
- Continuous improvement
- Cross-functional collaboration
- Technical leadership

Languages

- Brazilian Portuguese (native proficiency)
- English (full professional proficiency)
